INVENTION DISCLOSURE AND CLAIM STRATEGY MEMO - REVISED

Drafting changes made

Reconciled the package around a single reference-number system.

Removed duplicated claims/abstract sections from the earlier base package.

Added explicit environment-model uncertainty to the architecture and independent claims.

Moved health-aware constraint updating to the point before trajectory selection, matching the disclosed concept.

Distinguished the aircraft storage subsystem (116) from the evidence logger (220).

Distinguished the human supervisory station (240) from the communications manager (218).

Added mission-state conflict non-executability as an explicit claim element.

Removed unverified dimensions/specifications from the substantive disclosure.

Claim strategy

Independent claim 1 focuses on the integrated architecture and the control gate. Claims 3-19 add health prediction, authenticated mission contracts, communications degradation, reconciliation, evidence logging, model lifecycle, shadow evaluation, fallback, and distributed compute. Claims 20-24 provide method and computer-readable-medium coverage.

Attorney review items

Confirm novelty and non-obviousness through an expanded search.

Confirm that every inventor is correctly identified.

Confirm priority, ownership, government-interest, and public-disclosure facts.

Review whether any sensitive implementation details should remain proprietary rather than be disclosed.

Review the redrafted drawings for final USPTO compliance and whether additional views are needed.
