README AND ERROR-RESOLUTION LOG - REVISED

Package purpose

Updated working package based on the uploaded 33-page PDF and the latest drawing concept supplied in the conversation.

What was corrected

One coherent reference-number scheme is used across text and drawings. Duplicated claim/abstract sections were removed. Unverified aircraft dimensions from generated artwork were not carried into the patent disclosure. The architecture now consistently identifies environment uncertainty, health-aware constraint updates before trajectory selection, authenticated mission contracts, degraded communications, reconciliation, and evidence logging.

Drawing basis

The latest black-and-white drawing concept was used as a visual reference for the aircraft, exploded compute-stack, sensor-array, planning/safety, and system-overview content. The filing drawing set was redrafted as clean vector patent-style sheets rather than relying on AI-generated text embedded in the reference image.

Not yet filled

Inventor names, applicant/assignee, priority data, government interest, disclosure history, attorney docket, and actual filing fees/forms remain factual/legal items to be verified.
