DRAWING CHANGE LOG AND PRE-FILING QA

Resolved reference-number conflicts

Aircraft principal elements now use 100, 102, 104, 106, 108, 110, 112, 114, 116.

Autonomy functions use 200, 202, 204, 206, 208, 210, 212, 214, 216, 218, 220, 222.

Mission contract and supervisory station use 230 and 240 respectively.

No drawing uses the same reference numeral for unrelated components.

Corrected disclosure mismatches

The environment model is consistently described as carrying uncertainty information.

Health prediction is consistently described as updating planning constraints before trajectory selection.

Storage subsystem 116 is distinct from evidence logger 220.

The human supervisory station 240 is distinct from the communications manager 218.

Unverified dimensions and performance specifications from generated artwork have been removed from the substantive disclosure.

Drawing QA

Eight monochrome patent-style sheets are supplied as vector PDF artwork.

Each sheet has one principal figure and a sheet-number header.

Figures use concise labels and consistent reference numerals.

The drawing set is intended for attorney review and final USPTO preflight; counsel should verify line-weight, margins, reproduction, and any additional views needed for prosecution.
